Report

1.   INTRODUCTION

1.1   Business problem

When a person moves from one place to another, the adaptation may be hard. To improve the adaptation experience, it can be useful to search for the environment that they feel the most comfortable in. In this perspective, it is worth comparing different areas in the city when the person used to live and then in the city where they intend to move.

1.2   Who would be interested in this project

People who move or travel from one city to another.

2.   DATA

The data used comes from PLUTO website and Wikipedia.

3.   METHODOLOGY

I analysed the boroughs in New York (part 1) and Toronto (part 2) using Foursquare separately to find some common points at the end (part 3).

4.   RESULTS AND CONCLUSION

There are more boroughs in Toronto than in New York; in New York there are more neighbourhoods than in Toronto. New has two times more venues than Toronto. The vast majority of Toronto's places exists in New York. Three New York's boroughs (Manhattan, Queens and Brooklyn) have venues that are the most popular in Toronto.
